

# Mimic

A power tool  
for craftsmen

Mimic is a position sensing technology for a wide range of applications: from a point teaching for inspections or pick and place, to highly complex and smooth robot movements for painting and dispensing.

This technology is a framework for programming by demonstration. It is a powerful tool for craftsmen who work with tasks such as grinding, buffing, and painting, which are too difficult to program in a traditional way.

## 1. Track

Guide your robot in realtime or record your movement using Mimic joystick.

## 2. Tune

Preview and optimize the recorded movements by modifying speed, orientation and path.

## 3. Play

Start processing and let your robot do the hard work.
